ARD Series
Low Pressure Rupture Disks

Features
- State-of-the-art laser slotted metal section
- Mounts between standard ANSI Class 150 and 300 welding neck flanges, or equivalent with same bore diameter
- No disk holder required
- Standard materials of construction: 316SS metal section(s), Teflon seal, Compressed fiber gaskets (Other materials available)
- Operating pressures to 50% of the disk’s marked burst pressure
- Sizes 2” thru 36”
- Burst ratings 1 to 15 psig
- Temperature ratings to 500°F (260°C)
- Manufacturing range: all ARD Disks are supplied with 0% manufacturing range

Options
- Burst Indication
- Teflon Gaskets

Max. Temp. 500°F (260°C)

Table 2 – notes
• ARD Series Disks mount between standard ANSI Class 150 and 300 welding neck flanges, or equivalent with the same bore diameter.
Contact ZOOK if disk is to be mounted into other style flanges
• Contact ZOOK for sizes 14" and larger and burst ratings greater than 15psi

CAUTION for installation
• Additional gaskets NOT required
• 2" thru 24" installation between standard bore ANSI raised face flanges
• 30" thru 36" installation between standard bore MSS SP44 raised face flanges
• Contact ZOOK if disk is to be mounted into other style flanges

<tr>
<td>1 to 4 (0.07 to 0.28)</td>
<td>± 0.50 (± 0.03)</td>
</tr>
<tr>
<td>Above 4 (Above 0.28)</td>
<td>± 1.00 (± 0.07)</td>
</tr>
</tbody>
</table>

Table 3 – notes
• 0% manufacturing range is standard.
Disk will be marked with specified rating
• Burst tolerances are the maximum expected variation from the disk’s marked burst pressure

Storage Tank Protection
Storage tanks are made from relatively light gauge materials. This limits their ability to contain pressure and, if they are emptied without proper venting, makes them vulnerable to collapse. ARD Disks provide simple, inexpensive protection against either condition.

CAUTION
Disk size should be at least equal to the size of the flow inlet or outlet connection (whichever is greater) to the tank. Maximum rupture pressure should be no greater than the design pressure or vacuum (whichever is smaller) of the tank. Minimum rupture pressure should be at least double the maximum working pressure or vacuum (whichever is greater) to which the tank will be exposed.

Relief Valve Protection
Corrosive elements in the atmosphere can enter a relief valve through its outlet and attack the valve’s working parts. This may prevent the valve from functioning properly. Valves with outlets connected to common headers are especially vulnerable. An ARD Disk mounted on the valve’s outlet flange protects valve components from hostile environments. Consult ZOOK for guidance on applicable Code issues related to this application.

CAUTION
Disk size should be the same as the outlet flange of the valve. Maximum rupture pressure should be no greater than the set pressure of the valve. Minimum rupture pressure should be at least double the maximum working pressure in the header.
